

About DORIS

DORIS care is a discreet activity sensor that helps you stay safe and independent in your own home. It uses smart digital technology to learn your normal habits and if your activity levels change from their usual patterns, Careium will check you are OK.

-  No user interaction needed; people often forget the device is there
-  No internet or Wi-Fi needed for almost anywhere in the UK
-  No cameras or microphones to protect privacy

-  Replacement battery shipped for free when low
-  Alerts to Careium's 24 hours contact centre for a quick response
-  Very quick and easy installation

How does it work?

1. Simply place DORIS care in your kitchen
2. It learns your normal activity patterns using a smart sensor
3. The sensor will detect any change out of the ordinary. Careium will be alerted and contact you to make sure you are OK.

How to get started

First:

All you need to do is pull the clear plastic tab completely away from the back of the unit. This will now activate the device - it's that simple!

Then:

Place DORIS care in your kitchen (on a shelf or worktop), making sure you keep it away from direct sunlight. The sensor will now discreetly monitor the atmosphere and activity levels in the kitchen.

Ongoing:

DORIS care will silently send data to Careium every few hours. If there is a change to your normal patterns of behaviour or the temperature goes below 14 degrees or over 28 degrees for a 12-hour period, we will give you a call to check everything is ok. If we get no reply, we will call your nominated person so they can check you are OK – this is important as we will not call the emergency services, so please ensure you have someone who is available to call on you to check that you are ok.

Battery – DORIS care has a 3-year battery and when this needs replacing Careium will get an alert and send you a replacement for free.
